

Department of Aerospace Engineering
Indian Institute of Technology, Kharagpur

Subject: FEM in Aerospace Structures (114022)
 Spring Semester Final Examination, April 2001
 4th Year B.Tech. and M.Tech

Full Marks: 60

Time: 3 Hours

Answer all the questions

1. Define (a) shear correction factor (b) super-parametric element (c) non-conforming element and (d) shear locking problem.

Explain that the four noded rectangular thin plate element having w , θ_x , and θ_y as the degrees of freedom at each node is a non-conforming element. Give an example of a conforming thin plate element.

2. Write the shape functions of the four noded rectangular plane stress element having u and v as the degrees of freedom at each node.

If the nodal displacements of such an element are $u_1=1.0\text{cm}$, $v_1=0.5\text{cm}$, $u_2=1.5\text{cm}$, $v_2=0.6\text{cm}$, $u_3=1.4\text{cm}$, $v_3=0.4\text{cm}$, $u_4=0.8\text{cm}$ and $v_4=0.7\text{cm}$, calculate the strain components at the centre of the element. The nodal coordinates of the element are $x_1=100\text{cm}$, $y_1=50\text{cm}$, $x_2=200\text{cm}$, $y_2=50\text{cm}$, $x_3=200\text{cm}$, $y_3=100\text{cm}$, $x_4=100\text{cm}$ and $y_4=100\text{cm}$.

3. Write the shape functions of the four noded isoparametric element.

The nodal coordinates of such an element are $x_1=10\text{cm}$, $y_1=5\text{cm}$, $x_2=20\text{cm}$, $y_2=6\text{cm}$, $x_3=25\text{cm}$, $y_3=10\text{cm}$, $x_4=8\text{cm}$ and $y_4=10\text{cm}$. Calculate the determinant of the Jacobian at the element centre ($s=0$ and $t=0$). Also evaluate the integral $\int (5+3s)(2-4s)dx$ over the area of the element.

4. Evaluate the stiffness matrix and load vector of the frame shown in Fig. P-4. Take $E=200\text{GPa}$, $A=100\text{cm}^2$ and $I_z=25000\text{cm}^4$ for all the members.

5. The nodal coordinates of a curved beam element as shown in Fig. P-5 are $x_1=10\text{cm}$, $y_1=10\text{cm}$, $x_2=15\text{cm}$, $y_2=11.34\text{cm}$, $x_3=18.66\text{cm}$ and $y_3=15\text{cm}$. The degrees of freedom at each node are w , θ_s , and θ_t in local axis system while these are w , θ_x , and θ_y in the global axis system as shown. Evaluate the transformation matrix $[T]$ of the element to be used to express nodal displacement vector in local axis system to that in global axis system.
